

Setup PortoDB

- Install PortoDB from the Google Play Store. When PortoDB is installed it creates a folder on the internal SD card named PortoDB. In the PortoDB folder it creates a subfolder named Export.
- Download the tube data CSV file to your Android phone/tablet. Make note where the file is stored on your phone/tablet.
- Use a file manager to move the CSV file to the PortoDB/Export folder. This isn't absolutely necessary but I find it to be the easiest.
- Open PortoDB.
- Press the plus (+) button at the upper left to create a database. Name the database. I named mine "Tubes".
- Tap the menu key on your phone/tablet. Select Settings. Under Table View make sure "Freeze header" is checked. You can also show row ID's (numbers). Normally you don't want this. Back out of the settings.
- Tap the database name you created.
- Tap the menu key on your phone/tablet. Select "Import table".
- If you moved the CSV file to the export folder select "From export folder". If you didn't move the CSV select "From other source".
- Select the CSV file you want to import. Enter a table name and press OK. Press OK again when it asks "Are you sure...?"
- The CSV file will be imported. Tap the table name and you'll see the data.
- PortoDB Usage Notes:
 - With the table displayed press the Setting key. There are a number of selections. A couple to note is "Form view" when in "Table view" and "Table view" when in "Form view". You'll normally want "Table view".
 - To search the entire table tap the magnifying glass. Tap a column header to search only in that column.
 - There are a number of Press and Hold context menus.
 - Press and Hold the Database name or Table name for a menu of actions such as delete, rename, backup, restore, etc.
 - Press and Hold a column header for a menu of actions such as delete column, rename column, move column, etc.
